

Shahin-AI for **Government** and **Banking**

Secure AI-powered GRC operating workspace.

Powered by **DoganConsult.**

Regulated work is **critically fragmented**

Government and banking teams operate under intense regulatory scrutiny, yet critical governance work remains dangerously disconnected across silos.

Intense Regulatory Pressure

One connected workspace for GRC operations

Synthesis: Shahin-AI connects the organization's structure, policies, risks, controls, evidence, and AI agents into one trusted operating environment.

From fragmented data to connected executive truth.

Insight: Every user (Executive, Risk, Audit, IT) sees only what matters to their role, but all actions feed the same central truth.

Prepared for Saudi Sovereign Operations.

Synthesis: Shahin-AI is deployed with pre-mapped backend regulatory content, control libraries, and workflows—eliminating months of implementation friction.

NCA

Cybersecurity compliance readiness and evidence mapping.

SAMA

Banking, financial-sector controls, and operational risk.

PDPL

Privacy, personal data governance, and consent tracking.

ISO 27001

Information security alignment and audit preparation.

AI that works inside governance, not outside it.

Ungoverned AI (Standard Chatbots)

- Uses general prompts
- Operates as a black box
- Bypasses enterprise permissions
- Leaves no audit log

AI by Design (Shahin-AI)

- Context-aware agents
- Strictly restricted by DAuth (Identity & Authorization)
- Requires human-in-the-loop approval
- Fully logged in the immutable DSOC audit trail

Built-In Capabilities: Summarizes evidence, maps controls to regulations, identifies missing documentation, and drafts executive risk briefings.

The Anatomy of Shahin-AI.

Business Modules (The Product)

(What the customer buys).

Governance, Risk, Compliance,
Audit, AI Copilot.

Operating Controls (The Trust Layer)

(How the work is governed).

Ownership, Maker-Checker, Segregation of Duties
(SoD), Evidence Lineage.

Dogan-AI OS Platform (The Foundation)

(What makes it unreplicable).

Identity, Authorization, Workflow, Observability.

Takeaway: Customers experience Shahin-AI.
Dogan-AI OS powers the secure operating layer underneath.

The Trust Foundation: Powered by Dogan-AI OS.

Platform Value & Fundraising Roadmap

Dogan-AI OS + Shahin-AI is already a massive, built technology asset with over 2 million lines of code.

Valuation is not based solely on current recurring revenue. It is based on massive capital cost avoided, years of time saved, regulatory IP created, and the highly lucrative enterprise market it unlocks.

Powered by DoganConsult

The Valuation Floor: Rebuilding the Asset Today.

**Replacement Cost = Engineering Build Cost
+ Hidden Non-Code Execution Costs**

Raw Code
(Visible)

Architecture & Boundaries:
Service boundaries, platform kernel design.

Security & DAuth:
Access control, SoD rules, audit logs.

DevOps & QA:
Release confidence, deployment infrastructure.

Regulatory IP:
KSA controls, compliance logic mapping.

Data & AI Layer:
RAG architecture, tenant models, agent orchestration.

Takeaway:

Buyers forget that enterprise platforms cost exponentially more to harden than to code.

Illustrative Rebuild Scenarios for a 2M+ LOC Asset

Scenario	LOC / Eng-Month	Loaded Cost/Month	Implied Base Cost	Formula Output
Conservative	[X] LOC	3,000	SAR 35k	Formula Output
Base	[X] LOC	2,000	SAR 50k	Formula Output
High-Complexity	[X] LOC	1,500	SAR 70k	Formula Output

Complexity Multiplier: 1.5x – 3.0x
(Integration, microservices).

Non-Engineering Add-on: 20% – 40%
(QA, DevOps, Domain logic).

Strategic Note: This calculates the absolute valuation floor. It entirely excludes the massive opportunity cost of time-to-market.

Commercial Upside: Enterprise SaaS Multiples.

Implementation Fee + Annual Platform License
+ Module Packages + AI Premium + Support

SaaS Logic

In enterprise SaaS, a small number of high-value contracts creates meaningful ARR quickly.

Revenue Valuation = $ARR \times$
Market Multiple (e.g., 4x - 6x).

Government: Sovereign entities
(Private/On-Prem deployment, highest security).

Enterprise: Regulated companies
(Full workflow, evidence, dashboards).

Professional: Mid-market
(Shahin core + selected modules).

Starter: Local SMEs
(Cloud subscription).

The Final Valuation Framework.

Synthesis: A fair valuation sits securely above the replacement cost floor and below the future revenue upside until early pilots convert into ARR.

Fundraising Strategy: Raising by Milestone, Not Hope.

Investment Ask & Deal Structure.

Core Principle: Dogan-AI OS remains the strategic, founder-owned core IP.
Investment directly targets the commercial product layer (Shahin-AI).

Option A: Strategic Seed

Capital strictly for product hardening, packaging, and securing initial pilots

(Based on pre-money floor valuation).

Option B: Strategic Partner Round

Capital + Introductions, pilot access, and commercial support in KSA

(Yields improved equity terms due to strategic value).

Option C: Product-Layer JV

Partner fully funds commercialization of Shahin-AI. Dogan-AI OS remains core-owned; revenue/equity splits are negotiated strictly at the product level.

Shahin-AI by DoganConsult | Trusted Governance. Controlled Risk. Audit-Ready Intelligence.
